

How to Add Images to Blog Posts

Your blog system already supports images! Here's how to use them:

Quick Steps:

1. Add Images to Your Project

Create folder structure:

```
public/
├── images/
│   └── blog/
│       ├── your-image-1.png
│       ├── your-image-2.jpg
│       └── pattern-image.png
```

2. Add Image Path to Frontmatter

In your `.md` file, add the `image` field:

```
markdown

---
id: 5
title: "The Moment I Realized Everyone Is Faking It"
slug: everyone-fakes-it
date: December 7, 2025
category: Mental Health
image: "/images/blog/pattern-image.png"
featured: true
---
```

That's it! The image will automatically display.

Where Images Appear:

On Blog Listing Page:

- **Featured posts:** Large card with image at top
- **Regular posts:** Smaller card with image at top
- **No image?** Post still looks great, just no image

On Individual Post Page:

- **Hero image** at the very top (full width)
 - Appears above title and content
 - Very professional look!
-

Image Size Guidelines:

Recommended dimensions:

- Width: 1200px (minimum)
- Height: 675px (for 16:9) or 600px (for 2:1)
- File size: Under 200KB

Formats:

- PNG (best for graphics, patterns, illustrations)
 - JPG (best for photos)
 - WebP (best for performance, but check browser support)
-

Example: Using Your Instagram Pattern Images

Your Instagram pattern images would work perfectly!

Pattern image sizes:

- **Feed version (4:5):** 1080 x 1350 px
- **Stories version (9:16):** 1080 x 1920 px

To use them:

1. Save pattern image as PNG
 2. Resize to 1200 x 675 px (crop if needed)
 3. Put in `public/images/blog/`
 4. Reference in frontmatter
-

Complete Example:

File: `src/posts/everyone-fakes-it.md`

```
markdown

---
id: 5
title: "The Moment I Realized Everyone Is Faking It"
slug: everyone-fakes-it
date: December 7, 2025
category: Mental Health
tags:
  - mental health
  - anxiety
excerpt: "The quiet pressure to look like you have it all together..."
author: MoreThanOneWay Team
readTime: 1 min read
featured: true
image: "/images/blog/support-pattern.png"
---

# The Moment I Realized Everyone Is Faking It

Your content here...
```

File structure:

```
your-project/
├── public/
│   ├── images/
│   │   └── blog/
│   │       └── support-pattern.png ← Your image here
```

```
| └─ src/  
|   └─ posts/  
|       └─ everyone-fakes-it.md ← References image
```

Using External Images (Alternative)

You can also use external URLs:

```
markdown  
  
---  
image: "https://i.imgur.com/yourimage.png"  
---
```

Works for:

- Imgur
 - Unsplash
 - Any public image URL
-

Posts Without Images

Don't have an image? No problem!

Just leave out the `image` field:

```
markdown  
  
---  
id: 5  
title: "Your Post Title"  
slug: your-post  
date: December 7, 2025  
category: Career  
---
```

Posts without images still look great - they just skip the image section.

Image Best Practices:

DO:

☒ Use consistent aspect ratio (16:9 or 2:1) ☒ Optimize file size (under 200KB) ☒ Use descriptive filenames (`(mental-health-support.png)`) ☒ Test on mobile to ensure it looks good

DON'T:

- ☒ Use huge file sizes (slows page load)
 - ☒ Use inconsistent sizes (looks messy)
 - ☒ Use copyrighted images without permission
 - ☒ Forget to optimize images before uploading
-

Quick Image Optimization:

Online tools:

- TinyPNG.com (compress PNG/JPG)
- Squoosh.app (resize + compress)
- Canva (resize to exact dimensions)

Steps:

1. Upload your image
 2. Resize to 1200 x 675 px
 3. Compress to under 200KB
 4. Download and add to project
-

Example with Your Pattern Images:

Mental Health Post:

markdown

```
---
title: "You're Surrounded by Support"
image: "/images/blog/support-pattern.png"
---
```

Job Search Post:

```
markdown
---
title: "200+ Applications Is Normal"
image: "/images/blog/job-search-pattern.png"
---
```

Study Tips Post:

```
markdown
---
title: "Free Study Resources"
image: "/images/blog/study-resources.png"
---
```

Testing:

Step 1: Add image to public folder

```
public/images/blog/test-image.png
```

Step 2: Add to post frontmatter

```
markdown
image: "/images/blog/test-image.png"
```

Step 3: Run locally

```
bash

npm run dev
```

Step 4: Check both pages

- Blog listing: <http://localhost:5173/blog>
 - Individual post: Click on the post
-

Troubleshooting:

Image not showing?

Check:

1. Is file in `public/images/blog/`?
2. Is path correct in frontmatter? (starts with `/`)
3. Is filename spelled exactly right? (case-sensitive!)
4. Did you restart dev server after adding image?

Common mistakes:

- ✗ `image: "images/blog/test.png"` (missing leading `/`)
 - ✗ `image: "/src/images/test.png"` (wrong folder)
 - ✗ Image in `src/` instead of `public/`
-

Pro Tip: Create a Template

Save this in a text file for quick reference:

```
markdown
```

```
---
id: [NEXT_NUMBER]
title: "[POST_TITLE]"
slug: [post-slug]
date: [MONTH DAY, YEAR]
category: [Career|Academics|Mental Health]
tags:
  - tag1
  - tag2
excerpt: "[SHORT_DESCRIPTION]"
author: MoreThanOneWay Team
readTime: [X] min read
featured: [true|false]
image: "/images/blog/[IMAGE_NAME].png"
---
```

[POST_TITLE]

Your content here...

Summary:

1. **Create folder:** `public/images/blog/`
2. **Add images:** Put your PNG/JPG files there
3. **Reference in post:** Add `image: "/images/blog/filename.png"` to frontmatter
4. **Test locally:** `npm run dev`
5. **Deploy:** `npm run build && npm run deploy`

Your Instagram pattern images will look amazing as blog post headers! 🧠

Ready to add images? Just drop them in `public/images/blog/` and reference them in your markdown frontmatter!
